

## Marconi CSR-4A Chassis

Forensic analysis of CSR-4A chassis by Gerry O'Hara (still photos taken from video link posted on an eBay auction for the radio in August 2021).

Implied tube line-up: 2 x RF amplifier stages (6SK7s?), mixer (6L7 or 6J7?), local oscillator (6J7?), 3 x IF amplifier stages (3 x 6K7?), 1st AF/detector (6B8 or 6Q7?), BFO (6J7?), AF Driver (6C5?), push-pull output (2 x 6F6 or 6V6?) and rectifier (5Z3?). It may have had an eye tube in place of the S-Meter originally also. If this is the line-up, it is quite a bit more sophisticated than the CSR-5 and the SMR-3 circuits.
